ADR Soil Components
The Intelligence of Technology

moving innovation

ADR Soil Components. The Intelligence of Technology.

The ADR Soil hubs are equipped with:

- a robust seal integrated with steel elements
- different types of seals for various operating conditions
- bearings protected from contaminants

furthermore...

- ensure great reliability
- long duration
- no loss of grease
- maintenance free.

In agriculture we often find “samurai” soils, ready to fight with all means - stones, limestone, rock, mud - against handling and treatment machines, even the most advanced mechanical parts are often subject to dangerous wear.

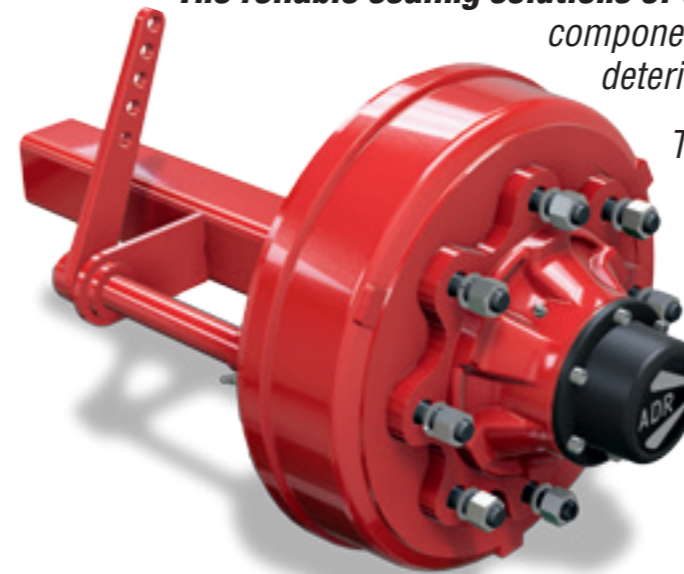

Quality of the materials are not enough to protect them and keep their efficiency unaltered.

The ADR SOIL project is born here

The success of a product comes from its “adaptability” but mainly on the **quality** of the project.

With **ADR Soil**, our technicians have created a series of specific components for soil treatment machines that with a single function, are able to respond to multiple application needs.

The reliable sealing solutions of the **ADR Soil range** preserve the functionality of the components because the effectiveness of the seals prevents the deterioration of the lubricant.

The products **ADR Soil** prevents any failure to seals in the field that can cause unplanned downtime, lost productivity, contamination of soil and crop.

In addition to the wheel hubs, surely the bearings are vital organs but also the most delicate.

ADR recommends a constant monitoring of the working conditions of the machines and an accurate and frequent maintenance.

ADR Soil Components, the range of semi-axes that does not require maintenance.
